# **DISC-NET ML Workshop**

## How to Do a ML Project

Details, Ideas, Research Methods

Adam Prügel-Bennett

DISCNET Machine Learning Course

# How to Do a Machine Learning Project?

- Starting a Machine Learning Project is daunting and requires you to think strategically
- The book "Hands-on Machine Learning with Scikit-Learn, Keras, and TensorFlow: Concepts, Tools, and Techniques to Build Intelligent Systems" by Aurélien Géron takes you through this
- In the Appendix there is a check list (also on a web page—see course page)

Adam Prügel-Bennett

DISCNET Machine Learning Cours

## 1. Frame the Problem and Look at the Big Picture

- 1. Define the objective in business terms
- 2. How will your solution be used?
- 3. What are the current solutions/workarounds (if any)?
- 4. How should you frame this problem (supervised/unsupervised, online/offline, etc.)?
- 5. How should performance be measured?
- 6. Is the performance measure aligned with the business objective?
- 7. What would be the minimum performance needed to reach the business objective?
- 8. What are comparable problems? Can you reuse experience or tools?
- 9. Is human expertise available?

Adam Prügel-Bennett

DISCNET Machine Learning Course

### 2. Get the Data

- Note: automate as much as possible so you can easily get fresh data
- 1. List the data you need and how much you need
- 2. Find and document where you can get that data
- 3. Check how much space it will take
- 4. Check legal obligations, and get authorization if necessary
- 5. Get access authorizations
- 6. Create a workspace (with enough storage space)
- 7. Get the data
- 8. Convert the data to a format you can easily manipulate (without changing the data itself)

### Outline

1. How to Do a ML **Project** 

Adam Prügel-Bennett

DISCNET Machine Learning Course

### Eight Steps

- 1. Frame the problem and look at the big picture
- 2. Get the data
- 3. Explore the data to gain insights
- 4. Prepare the data to better expose the underlying data patterns to Machine Learning algorithms
- 5. Explore many different models and short-list the best ones
- 6. Fine-tune your models and combine them into a great solution
- 7. Present your solution
- 8. Launch, monitor, and maintain your system

Adam Prügel-Bennett

DISCNET Machine Learning Cours

- 10. How would you solve the problem manually?
- 11. List the assumptions you (or others) have made so far
- 12. Verify assumptions if possible

DISCNET Machine Learning Course

- 9. Ensure sensitive information is deleted or protected (e.g., anonymized)
- 10. Check the size and type of data (time series, sample, geographical, etc.)
- 11. Sample a test set, put it aside, and never look at it (no data snooping!)

DISCNET Machine Learning Course Adam Prügel-Bennett

DISCNET Machine Learning Course

# 3. Explore the Data

- Note: try to get insights from a field expert for these steps.
- 1. Create a copy of the data for exploration (sampling it down to a manageable size if necessary)
- Create a Jupyter notebook to keep a record of your data exploration
- 3. Study each attribute and its characteristics:
  - Name
  - Type (categorical, int/float, bounded/unbounded, text, structured, etc)
  - Number of missing values
  - Noisiness and type of noise (stochastic, outliers, rounding errors, etc.)

Adam Prügel-Bennett

DISCNET Machine Learning Course

#### 4. Prepare the Data

- Notes
  - ★ Work on copies of the data (keep the original dataset intact)
  - Write functions for all data transformations you apply, for five reasons:
    - So you can easily prepare the data the next time you get a fresh dataset
    - \* So you can apply these transformations in future project
    - \* To clean and prepare the test set
    - \* To clean and prepare new data instances once your solution is live
    - To make it easy to treat your preparation choices as hyperparameters

Adam Prügel-Bennett

Serie / Madaine Editining Course

- Aggregate features into promising new features
- 4. Feature scaling: standardise or normalise features

Adam Prügel-Bennett

DISCNET Machine Learning Course

Short-list the top three to five most promising models, preferring models that make different types of errors

- Possibly useful for the task?
- Type of distribution (Gaussian, uniform, logarithmic, etc)
- 4. For supervised learning tasks, identify the target attribute(s)
- 5. Visualise the data
- 6. Study the correlations between attributes
- 7. Study how you would solve the problem manually
- 8. Identify the promising transformations you may want to apply
- 9. Identify extra data that would be useful
- 10. Document what you have learned

Adam Prügel-Bennett

DISCNET Machine Learning Course

10

### 4. Prepare the Data continued

- 1. Data cleaning
  - Fix or remove outliers (optional)
  - Fill in missing values (e.g., with zero, mean, median. . . ) or drop their rows (or columns)
- 2. Feature selection (optional):
  - Drop the attributes that provide no useful information for the task
- 3. Feature engineering, where appropriate:
  - Discretize continuous features
  - Decompose features (e.g., categorical, date/time, etc.)
  - Add promising transformations of features (e.g.,  $\log(x)$ ,  $\sqrt{x}$ ,  $x^2$ ,  $\mathrm{e}^x$  , etc.)

## 5. Short-List Promising Models

- 1. Train many quick and dirty models from different categories (e.g., linear, naiveBayes, SVM, Random Forests, neural net, etc.) using standard parameters
- 2. Measure and compare their performance
  - For each model, use N-fold cross-validation and compute the mean and standard deviation of the performance measure on the N folds
- 3. Analyse the most significant variables for each algorithm
- $\ensuremath{\mathsf{4}}.$  Analyse the types of errors the models make
  - What data would a human have used to avoid these errors?
- 5. Have a quick round of feature selection and engineering
- $\ensuremath{\mathsf{6}}.$  Have one or two more quick iterations of the five previous steps

DISCNET Machine Learning Course

14

### 6. Fine-Tune the System

Notes:

Adam Prügel-Bennett

- You will want to use as much data as possible for this step, especially as you move toward the end of fine-tuning
- \* As always automate what you can
- 1. Fine-tune the hyperparameters using cross-validation
  - Treat your data transformation choices as hyperparameters, especially when you are not sure about them (e.g., should I replace missing values with zero or with the median value? Or just drop the rows?)
  - Unless there are very few hyperparameter values to explore, prefer random search over grid search. If training is very long, you may prefer a Bayesian optimisation approach

DISCNET Machine Learning Course

Adam Prügel-Bennett DISCNET Machine Learning Course 15

- 2. Try Ensemble methods. Combining your best models will often perform better than running them individually
- Once you are confident about your final model, measure its performance on the test set to estimate the generalization error

Adam Prügel-Bennett

DISCNET Machine Learning Course

17

### 8. Launch

- Get your solution ready for production (plug into production data inputs, write unit tests, etc.)
- Write monitoring code to check your system's live performance at regular intervals and trigger alerts when it drops
  - \* Beware of slow degradation too: models tend to "rot" as data evolves
  - \* Measuring performance may require a human pipeline (e.g., via a crowd-sourcing service)
  - Also monitor your inputs' quality (e.g., a malfunctioning sensor sending random values, or another team's output becoming stale). This is particularly important for online learning systems
- Retrain your models on a regular basis on fresh data (automate as much as possible)

Adam Prügel-Bennett

DISCNET Machine Learning Course

# 7. Present Your Solution

- 1. Document what you have done
- 2. Create a nice presentation
  - Make sure you highlight the big picture first
- 3. Explain why your solution achieves the business objective
- 4. Don't forget to present interesting points you noticed along the way
  - Describe what worked and what did not
  - List your assumptions and your system's limitations
- 5. Ensure your key findings are communicated through beautiful visualizations or easy-to-remember statements (e.g., "the median income is the number-one predictor of housing prices")

Adam Prügel-Bennett

DISCNET Machine Learning Course

#### In Conclusion

- Its a long list
- Not everything might be relevant
- But there is quite a lot of wisdom, so review the list regularly during the project
